

Incorrect. The complete table should look like this:

	Total cost (\$)	=	Price (\$/ pound)	*	Amount (pounds)
Walnuts	$5x$	=	5.00	*	x
Cashews	72	=	12.00	*	6
Total Mix	$8(x + 6)$	=	8.00	*	$x + 6$

What equation can you create in order to solve this problem? Can you use the information in the Total Cost column?
