

Correct. Applying the Distributive Property to  $-(2x^2 + 4x^2)$ ,  $2(-4x^2y + 3y)$ , and  $-(7y + 12x^2 - 1)$  gives you  $8x^2y - 2x^2 - 4x^2 + 13 - 8x^2y + 6y - 7y - 12x^2 + 1$ . Simplifying this equation yields  $-18x^2 - y + 14$ .
