Use the factor label method to convert from grams to kilograms and fill in the missing measurement for the problem below.

Freda bought 700 grams of almonds and 500 grams of cashews. How many kilograms of nuts did Freda buy in all?

$700 \text{ grams} + 500 \text{ grams} = 1,200 \text{ grams}$

$$\frac{1,200 \text{ grams}}{1} \cdot \frac{1 \text{ kilogram}}{1,000 \text{ grams}} = ? \text{ kilograms}$$
