

While subtracting g from f , you may have combined the two middle *unlike* terms of the functions. Set up the problem as follows:

$$\left(\frac{f-g}{h}\right)(x) = \frac{f(x) - g(x)}{h(x)} = \frac{10x^3 - 15x^2 - 5 - (-10x^3 - 10x - 5)}{5x}$$

Be careful to distribute the minus sign to all terms in g . Combine like terms only, factor the numerator, and simplify.
